Customer Churn Analysis & Retention Insights Dashboard

Overall Churn Rate

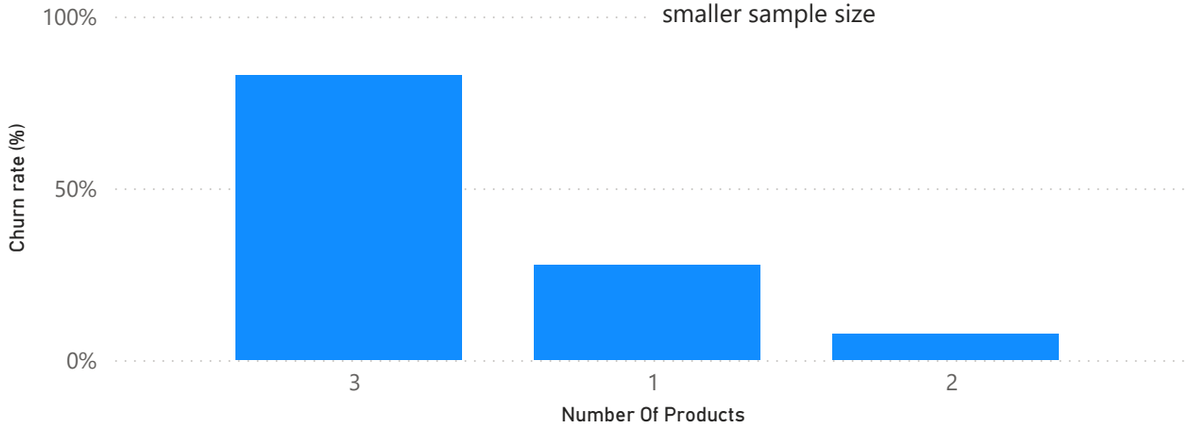
20.37%

Churn Rate

Inactive customers churn ~2× more than active customers, making engagement a key driver of retention.

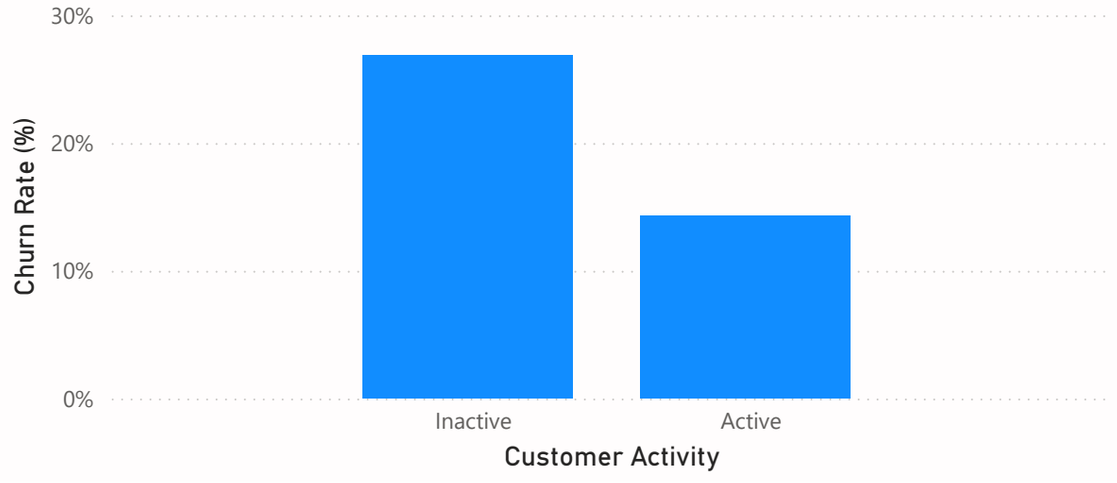
Churn Rate by Number of Products

Note: Higher churn for 3 products is based on smaller sample size



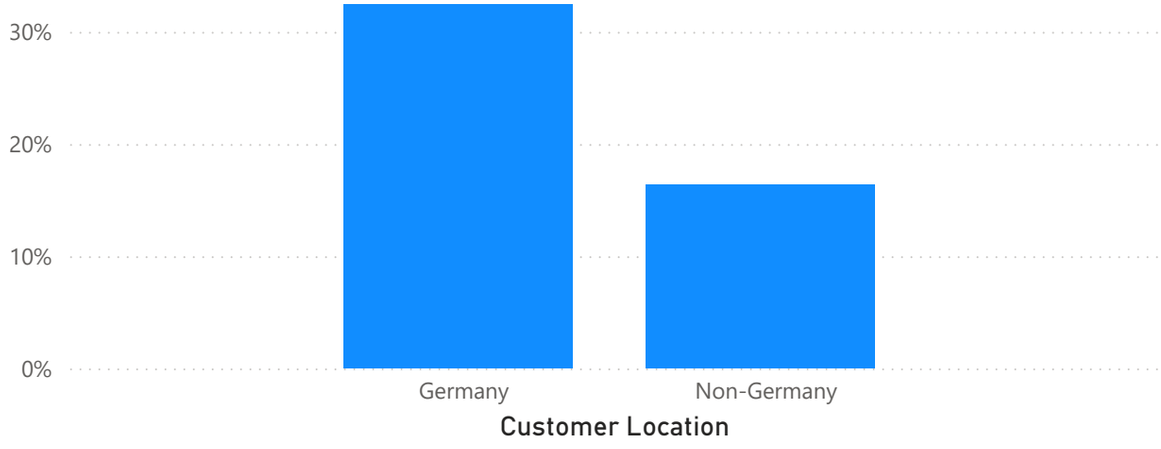
Customers with 3 products show high churn, indicating cross-selling or experience issues.

Churn Rate by Customer Activity

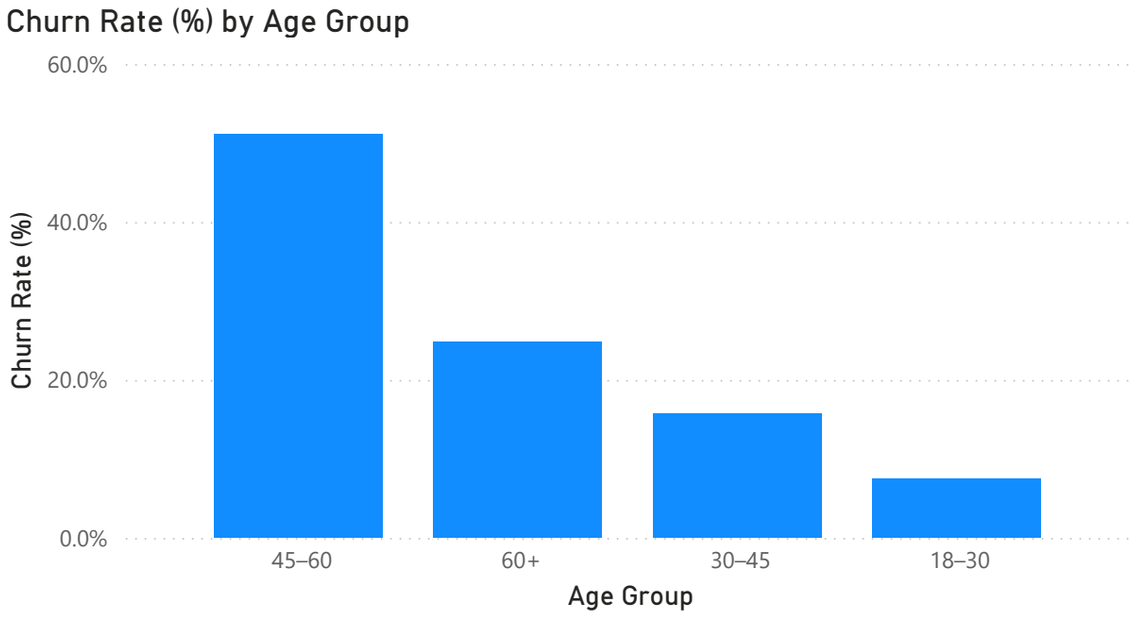


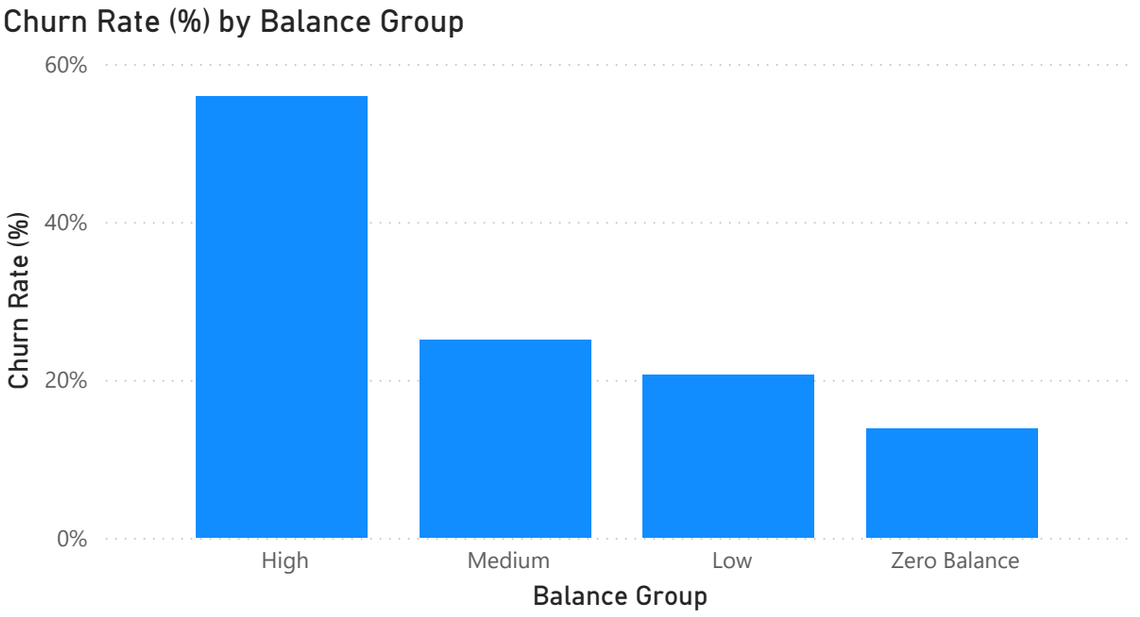
Inactive users are far more likely to churn, making engagement a key retention lever.

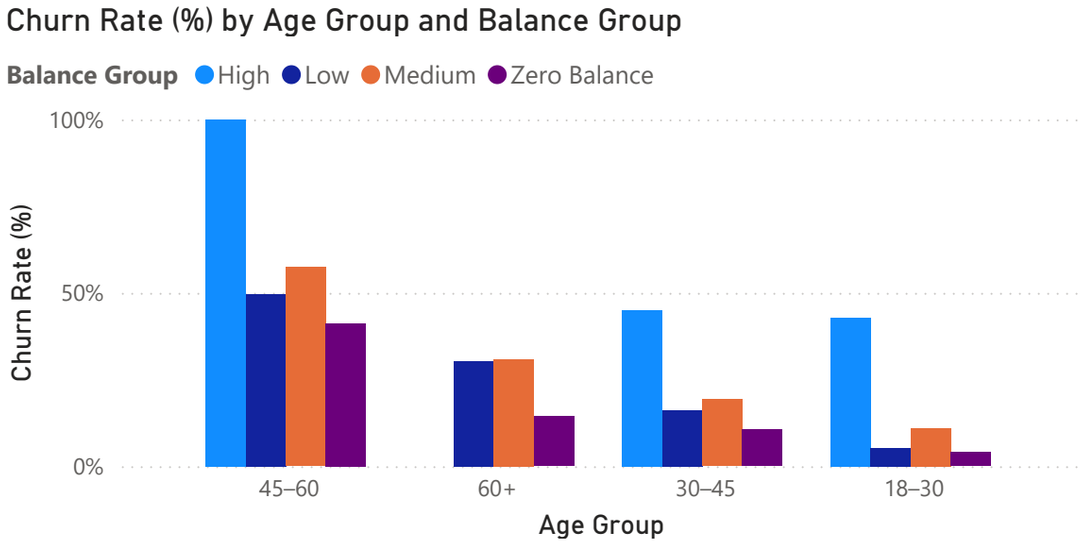
Churn Rate: Germany vs Non-Germany



Germany customers show ~2× higher churn, highlighting strong regional impact on retention.

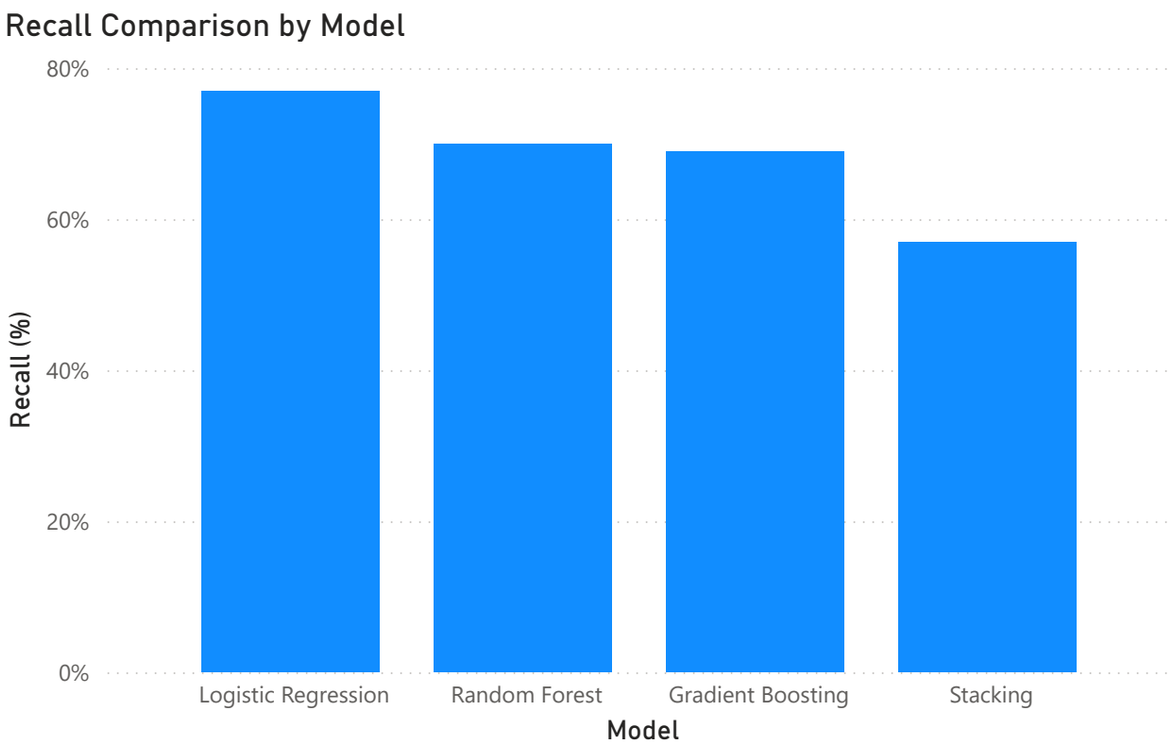


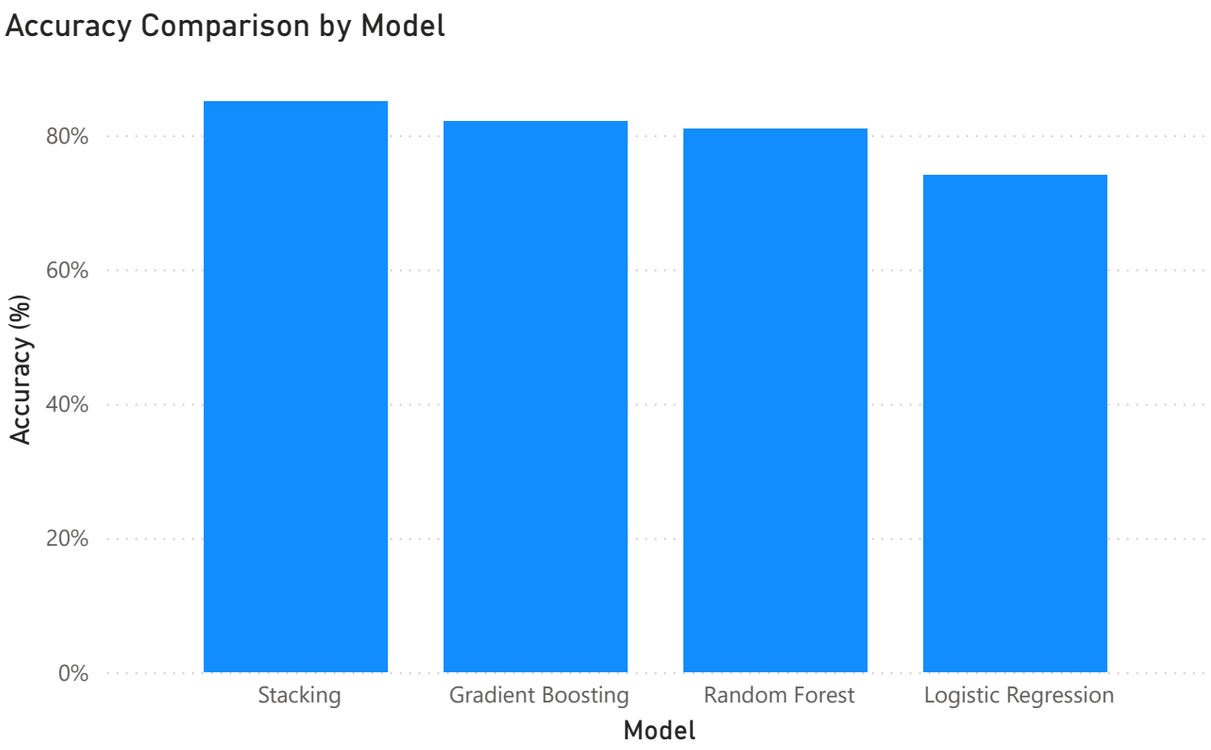




Key Insights:

- Customer inactivity and engagement are major drivers of churn
- Customers aged 45–60 show significantly higher churn
- High-balance customers are more likely to churn
- The highest-risk segment is older customers with high balances
- Some extreme values may be influenced by smaller sample sizes





Logistic Regression maximizes recall and is best for identifying churners, while Stacking achieves the highest accuracy at the cost of missing more churn cases. Random Forest offers the best balance between accuracy and recall, making it the most practical choice for deployment.
